🔧 Top Agentic AI Frameworks (as of 10/16/2026)

(1) According to **CoPilot:**

Framework	Description	Best For	Notable Features
LangGraph	Graph-based orchestration built on the LangChain ecosystem	Stateful multi-step agents	Durable execution, checkpoints, human-in-the-loop, graph workflows
OpenAI Agents SDK	OpenAI's official agent framework	OpenAI-centric agent systems	Tools, guardrails, handoffs, sessions, tracing, MCP support
CrewAI	Role-oriented multi-agent collaboration	Agent teams and task delegation	Simple abstractions, crew-based design
Microsoft Agent Framework	Microsoft's unified agent platform	Enterprise and Azure deployments	Workflows, agents, sessions, MCP integration, AutoGen successor
Google ADK	Google's open-source agent development framework	Gemini and Google ecosystem projects	Multi-agent support, graph workflows, deployment tooling
LlamaIndex	Retrieval-centric framework with agent support	RAG and knowledge-intensive systems	Indexing, retrieval workflows, agent executors
PydanticAI	Type-safe Python framework for agents	Reliable production applications	Structured outputs, validation, observability
LangChain	General LLM application framework	Rapid prototyping	Large ecosystem, integrations, tool support
SmolAgents	Lightweight agent framework from Hugging Face	Educational and local-model projects	Small API surface, open-model friendliness
DSPy	Declarative framework for optimizing LM programs	Research and optimization	Evaluation-driven workflow design

(2) According to **Gemini**

Framework	Orchestration Style & Description	Best For	Notable 2026 Features & Shifts
LangGraph 1.x	**Graph-based state machines**. Uses cyclic graphs to manage intricate multi-agent workflows with state persistence.	Complex, branching, and deterministic enterprise workflows.	Fully production-hardened; advanced human-in-the-loop (HITL) checkpoints; excellent error-recovery. The default academic standard for strict control.
Microsoft Agent Framework 1.0	**Graph & Event-driven orchestration**. The official, unified successor that supersedes both AutoGen and Semantic Kernel.	Enterprise stacks heavily integrated with Azure and .NET/C#.	Released GA in April 2026. Native native support for MCP and A2A protocols; great cross-language capability (Python + .NET).
CrewAI	**Role-based multi-agent teams**. Agents are modeled explicitly around tasks and defined worker personae.	Rapid prototyping; fast multi-agent demos; intuitive teamwork setups.	Upgraded with *Flows* for added deterministic execution control alongside its classic autonomous *Crews*. Native MCP tool ingestion.
OpenAI Agents SDK	**Handoff-centric orchestration**. Minimalist, lightweight routing framework native to OpenAI models.	GPT-centric agent loops with low-friction text/code sandboxing.	Built entirely around agent-to-agent delegation via direct model handoffs. Relies natively on the OpenAI Agent Platform runtime for state tracking.
Google ADK 2.0 (Agent Development Kit)	**Hierarchical orchestration**. An opinionated toolkit focusing parent agents cascading tasks to specialized sub-agents.	Multimodal agents (video, voice, text) natively deployed on Google Cloud/Vertex AI.	Leading framework for high-accuracy multimodal reasoning. Fully spearheads the open A2A cross-framework agent interaction network.
Pydantic AI 2.0	**Type-safe composable code**. Pure Pythonic framework mapping LLM outputs tightly to type-validated structures.	Python developers who want lean, explicit agent loops without heavy abstractions.	Emphasizes deterministic data-validation, structural testing, and zero "black-box" magic. Highly favored for data-engineering agents.
LlamaIndex Workflows 1.0	**Event-driven, retrieval-centric workflows**. Centers the agent architecture strictly around indexing and complex RAG pipelines.	Knowledge-heavy apps, document intelligence, and advanced structural RAG.	Migrated away from simple sequential "agents on top of indices" to a full event-driven pipeline architecture.
Mastra	**TypeScript production workflows**. A full-stack TS-native engine for building event graphs.	JavaScript/TypeScript stacks, Vercel ecosystems, and Next.js applications.	Features built-in ecosystem developer tooling, rich observability tracing, and distinct suspend/resume approval primitives.
smolagents	**Code-executable tool calling**. A minimalist, lightweight framework spearheaded by Hugging Face.	Local model experimentation and compact code-generation tasks.	Keeps abstractions incredibly small; natively focuses on agents executing their actions directly by running secure local Python snippets.

(3) According to **ChatGPT**

Framework	Best fit for a student project
LangGraph	Stateful workflows, planning loops, and human-in-the-loop systems
OpenAI Agents SDK	Tool use, agent handoffs, and a relatively lightweight implementation
CrewAI	Role-based multi-agent collaboration
Google ADK	Composable agents and Google ecosystem integration
Microsoft Agent Framework	Enterprise workflows and Python/.NET integration
LlamaIndex	Retrieval-augmented generation and document-centric applications
Pydantic AI	Typed outputs, validation, and reliable structured NLP tasks
Hugging Face smolagents	Lightweight agents, open models, and learning tool-use mechanics
DSPy	Research on optimizing LLM pipelines and measuring task performance
Haystack	Search, retrieval, and document-grounded question answering
